Notes on Repetitive Avalanche Curves , Figures 14, 15:
(For further info, see AN-1005 at www.irf.com)

1. Avalanche failures assumption:
Purely a thermal phenomenon and failure occurs at a temperature far in excess of T_{jmax} . This is validated for every part type.
 2. Safe operation in Avalanche is allowed as long as neither T_{jmax} nor I_{av} (max) is exceeded
 3. Equation below based on circuit and waveforms shown in Figures 17a, 17b.
 4. $P_D(\text{ave})$ = Average power dissipation per single avalanche pulse.
 5. B_V = Rated breakdown voltage (1.3 factor accounts for voltage increase during avalanche).
 6. I_{av} = Allowable avalanche current.
 7. ΔT = Allowable rise in junction temperature, not to exceed T_{jmax} (assumed as 25°C in Figure 14, 15).
- t_{av} = Average time in avalanche.
 D = Duty cycle in avalanche = $t_{av} \cdot f$
 $Z_{thJC}(D, t_{av})$ = Transient thermal resistance, see figure 11)
- $$P_D(\text{ave}) = 1/2 (1.3 \cdot B_V \cdot I_{av}) = \Delta T / Z_{thJC}$$
- $$I_{av} = 2 \Delta T / [1.3 \cdot B_V \cdot Z_{th}]$$
- $$E_{AS(\text{AR})} = P_D(\text{ave}) \cdot t_{av}$$
